

ZoneWay

Subject: Access and intervention procedures in controlled areas on nuclear sites.

Type of application : Serious game in Virtual Reality, for PC + HTC Vive VR Headset

Objective:

Understand and integrate the procedures to be followed when working in a controlled area.

This application offers a MCQ and an "E-learning" approach allowing the learner to be monitored. The learner will have to carry out the different steps related to the entry in the zone and to his intervention on a building site. There are two levels of difficulty, the first one guides and assists the learner on the tasks he has to perform, the second one proposes a free mode, without assistance and with questions allowing the continuation of the "game".

These modules are accompanied by an administration interface with a learner follow-up to evaluate the knowledge acquired and the points to be developed.

There is an e-learning module in the application in order to find courses on themes predefined by the trainer, as well as several MCQs on the above-mentioned themes, all these modules are configurable via the administration interface. All these data are hosted on databases, which means that all courses and MCQs are sent to your application park.
